1. Introduction

Nashik, the city of Pilgrimage has a rich historical and mythological background. The city has its roots in the famous mythological epic Ramayana. The city is situated on the either side of the banks of River Godavari, has been named as Padmapur (City of Lotus) in historical days and Gulshanabad (City of flowers) during the Mughal regime. These names leave us with a thought about the kind of vegetation and green cover in and around this city since ages. The city in the last few years has transformed into a metropolis city and have gained importance as an educational and IT hub.

The city is situated at an altitude of 700 m above MSL with pleasant climate for most of the year. The total area under the jurisdiction of Nashik Municipal Corporation is around 259.12 sq. km. The population of Nashik city was 1,486,053 (as per the 2011 census). The city is divided into 6 divisions mainly Nashik (East), Nashik (West), Panchavati, Nashik Road, New Nashik and Satpur division. These divisions are in total divided into 31 wards.

1.1 Why Tree Census??

In view of "The Maharashtra (Urban Areas) Preservation of Trees Act (1975), for better preservation, protection and plantation of trees on Urban areas, it is binding to the Municipal Corporation to carry out a census of trees in all lands within the jurisdiction once before 1996 and thereafter once in every five years. This is the reason why this activity has been taken up by the concerned authorities.

The contract of the Tree census was awarded to Terracon Ecotech Pvt. Ltd., Mumbai on December 20, 2016.

1.2 Definition of Tree

A plant, by habit, having woody stem or trunk having minimum girth of 10 cm at chest level and has a height of 1.3 m above the ground level (Maharashtra Tree Act 1975 & Various Flora / Field Books on plants).

1.3 Outcomes of the Tree census work

It is one of the best tool for the management and maintenance of city's green cover as well as native biodiversity. It also helps in understanding the species composition of the studied area, tree to human population ratio, monitoring and maintenance, management of defective trees, carbon sequestration potential, etc.

1.4 Objectives of the Tree census work

- To survey the trees in all lands, inclusive of government, private and corporation property, by counting each and every tree using census method.
- To provide the information on the secondary attributes like botanical name, family, flowering season, colour of the flower, aesthetic/ economic value, etc.

2. Materials and Methods

The first and foremost important step while conducting the field study is collecting the proper and appropriate quality raw data. This primary data proves to be the base for whole of the project and helps in deducing various conclusions during the entire project process.

Thus, keeping these things in mind, we started collecting the primary data. In order to collect the primary data from the field, a mobile based geo enabled survey application was developed named as 'VrukshSharad'. The ward boundaries from the Nashik Municipal Corporation, Nashik were procured and calibrated in the survey application.

Simultaneously, the data collected using mobile application was synchronized with the web-based application. This helped in transfer of collected data on the field directly from the mobile application to the main server. The data transfer activity was an ongoing activity.

2.1 Mobile application

The application was installed in the geo enabled mobile devices (Make: - Moto, Model: Moto G Turbo Edition) and these devices were handed over to the field officers. The field officers were trained botanists/taxonomists, who can identify tree species on field. In case if tree remains unidentified on the field, the photographed were shared with experts to identify as well as using flora and other field guides. The areas were allocated to respective teams and the survey was carried out.

A survey form was prepared and used to conduct the survey, the details of the same are mentioned below. While conducting the survey, every field officer first identified the tree species and filled in the name of the tree species in the survey form. The actual girth of tree species at chest level (in metres) was measured using a measuring tape and was filled in the survey form. Various other attributes like approx. height and age, condition of the tree, canopy diameter were filled in the survey form. By the end of the day, the data was uploaded by the field officer and thereby it was submitted to the server. Before moving towards the next tree individual, every tree individual was marked with an oil pastel colour in order to understand whether the tree individual has been censuses or not.

If in case, the tree was not identified on the site, the photographs were clicked of the leaf, stem, fruit, flower, canopy etc and were send to the subject expert. The Flora of the Presidency of Bombay (by Sir Theodore Cooke), The Flora of Maharashtra (by Dr. Almeida) and various field guides were used for identification of these species. Thus, the data collected during the field visit is uploaded by the field officer, which was transferred directly to the main server. An overview of the mobile application page is shown below: -

The main screen of the application named “VrukshSharad”. The login credentials (username and password) are filled in by the respective field officers for carrying out the tree census work.

The home screen of the application consist of 4 main options namely Summary, Add a tree, Map and Analytics. Before, the field officer fill in the survey form, the device checks the accuracy and thereafter allows the surveyor to conduct the activity.

Add Tree Details

Ward No.*	12 (Assigned)
Field Officer Name*	Ashwin Jagtap
Landmark (Area)*	
Common Name	Unidentified
Ownership	None
Girth(m)*	0.3

Tree No.
354103074962717_1514458276776_3268

Name :- Madhuca longifolia
Ward No. 8

As one clicks on the option - Add a tree - a form will be displayed on the screen which will mention the Ward no and field officer's name. The later details like Landmark, Common name, Ownership, Girth, Height, Age, Canopy diameter, Condition, etc is filled in by the field officer. After completing the survey, one can find the details of the censuses tree in the option named Summary. The treeid with the physical attributes are shown here. The data is thereby uploaded by the field officer by clicking the "upload" button.

The third option is Map which helps to identify and relocate the field officer in the respective ward. The map options majorly helps during the count at ward boundaries. The fourth option is Analytics which helps the field officer to understand the tree count and its related data for a given period with various statistical features.

2.2 Web application

After the data has been collected from the field by the respective field officer, it is uploaded and directly transferred to the main server or the web portal named as “VrukshSharad”. The url for this web application is <https://vrukshasharad.locobuzz.com/account>. The main page will ask for the login credentials which after one can login in to the home page of this web application.

After reaching to the home page of VrukshSharad, you will find two options namely Dashboard and Map. The dashboard will take you the screen which reflects the ongoing work with various analysis reports and pie charts. The map will take you the screen where the schematic representation of the tree census can be visualised.

a. Dashboard

This option envisages various analytics and are visualized in the form of pie charts. The total number of field officers on work on a given day can be seen, the total count of the given day can be seen and thereby the total count till date can be seen on the dashboard.

The timeline option is available on the dashboard which will help to understand the trend of the work being done. Similarly, a pie chart reflecting the top 5 field officers based on their tree count can be seen.

Various other pie charts depicting the Tree condition, the ongoing wards, common and uncommon trees can be seen on the dashboard.

b. Map

The map gives the visual representation of the tree census work. The corporation and ward boundaries of the Nashik are assigned in the map. Thus, based on this the area covered and percentage completion of the work can be understood.

The map is equipped with four major options namely Zoom in (+), Zoom out (-), Search (\$) and Polygon (P). The zoom in and out options helps to enlarge or lessen the map size.

The search (\$) option is enabled with various attributes which helps in understanding the actual data. These attributes helped in searching the data using any attribute like - on the basis of treeid, ward no, enumerator, landmark, common name, girth, height, age, canopy diameter, condition of the tree, remarks, survey date or comment. Thus, as per the requirements different kinds of reports can be generated from the search option.

The polygon (P) option can be used in a way where the data is required of a specific area. The polygon can be plotted in this context to understand the tree census in the area of choice.

In the whole process the data is collected with the help of mobile application and is uploaded. The uploaded data is transferred to the web application and is reflected on the dashboard and map. The data can be segregated on the basis of various filters available in the search option. Finally, data is extracted from the web application or server for further verification. After verification, the curated data was transferred to the server again which will be available for further use.

For more technical information on mobile application and web application, please find the manual attached.

3. Results and Conclusions: -

A data set consisted of tree data of 2,500,000 individuals. The results are obtained based on individual tree count, ward wise tree count, ownership wise, height wise, age wise, canopy wise and condition wise. The results obtained are as follows

3.1 Individual Wise Tree data:

Giripushpa was the most dominant tree species with 45% occurrence to the entire population of trees within the city. It was followed by Babhul (18%), Subabhu (13%) and Bor (3%).

**Fig 01: The Individual tree species wise data.**

3.2 Ward wise Tree data:

Ward no 31 contributed the maximum vegetation and green cover to Nashik city with around 20%. This was followed by Ward no 6 (14%), Ward no 19 (14%) and ward no 27 (12%) respectively.

**Fig 02: The Ward wise tree data.**

3.3 Ownership wise tree data:

Maximum trees were recorded from Government sector. 55% of the trees are on government owned land followed by Private (41%), Industry (1%), Roadside (1%) and Park (1%). The Government land is

divided into Forest land, Defence land and land under Municipal Corporation i.e. NMC, Nashik. Amongst this, the maximum trees were found under the Forest owned lands followed by NMC and Defence area.

Fig 03: The Ownership wise tree data.

3.4 Condition wise tree data: -

97% of trees are found healthy whereas 3 % are Cut or manually pruned.

Fig 04: The Ownership wise tree data.

4. Discussion

Nashik city harbours an extensive diversity of tree species. The recent tree census revealed that it possesses around 257 different species. Out of these 70% species are indigenous/ native and remaining 30% are of exotic origin. The concern, however, is that the percentage of individuals belonging to native species (34%) was outnumbered by those belongs to exotic species (66%) growing in the vicinity. Out of the counted 4,795,387 counted trees, the exotic species, Giripushpa (*Gliricidia sepium*) (45%) and Subabhl (*Leucaena leucocephala*) (13%) have covered majority of the hillocks/ peaks and open spaces surrounding Nashik city. This specifies that the 60% of the city's vegetation is contributed by exotic species which is an alarming situation for the city. Thus necessities better management of city's native biodiversity.

A big question was raised amongst the minds about their arrival in the city. It was shocking to know that these species were considered in the plantation program by Forest Dept. Taxonomically if we look at both the species, both are the members of legume-bearing family and thereby large numbers of seeds are produced by these plant species. As mentioned earlier, these species were planted at the open spaces, peaks, hillocks in and around the city. Being planted at high altitudes, the legumes and seeds with it are dispersed to large areas leading to successful seed dispersal and thereby germination in the favorable condition. In open spaces, the dispersal agents are diverse. Thus, it leads to the successful acquisition of both the areas and leading to a higher growth rate.

The mono culture of these species have led to reduction in the native flora and thus had an impact on the native fauna. Measures are required to be taken for the irradiation of such exotic noxious tree species. A major suggestion goes with the slow and gradual removal of these exotic species which are proving threat to indigenous flora and fauna. The incorporation of native flora will call up on the native fauna like insects, which will attract the native avifauna and this will keep going on. Finally, this will enrich the biodiversity of the city and surrounding areas. All various forms of birds will be encountered in the city itself rather than moving for remote places to locate them.

Various open spaces are available in and around the city premises. The plantation of exotic species at the hillocks/ peaks should immediately be stopped and these areas should be focus for the plantation of native species. The construction projects, upcoming parks, factories and industries etc will also be consider for better green space management by using native species for plantation. Although exotic, cultivated species were preferred due to its aesthetic beauty the indigenous and native species harbours and nurtures native fauna. This is directly proportional to the health of city and other climatic factors. Trees like Bahava, Dhawda, Waras, Bhokar, Bor, Gondhan, Vad, Payar, Palash, Sisham, Falsa, Dhaman, Pandhara Khair, Mahavruksh, Apta, Arjun, Asana, Nandrukh, Newar, Kadamb, Kalam, Karanj, etc. needs to be taken in plantation considering their role in habitat improvement and ecological features. All these trees are growing naturally and luxuriantly in and around Nashik City. Our key role lies in bringing these species in cultivating and planting them. This will help the *Nashikites* to understand the importance of indigenous and native species and would be aware about them too.

In order to enhance the beauty of city, Nashik city has equipped itself with around 486 public parks and gardens. The very beautifully managed and controlled parks are the best site of education and precipitating the information about trees, birds and animals to the citizens. The gardens can be planted with indigenous tree species with a display on its basic information. Few display boards can be placed which will depict the birds, insects or animal life of the city. These things will educate the citizens and majorly the young generation about the need of conservation and preservation of various species. Tree walks can be organized in various gardens/ parks/ reserved forest areas by the Garden Dept., which will also educate and create awareness about the intricacy of flora and fauna. All these activities will involve the citizens of city to actively participate the conservation of natural wealth of the city.

- In 2016-17 Nashik Municipal Corporation had conducted the tree census.
- The total number of trees is 47,95,387. After completion of the tree census work during the maintenance period 3,889 trees were added. So the total number of trees in the Nashik Municipal Corporation area is 47,99,276.
- Out of the 47,99,276, trees 1,988 trees are heritage trees (tree age 50 or more) the list of heritage trees is attached here.

Nashik Municipal Corporation, Nashik
Dept of Garden & Tree Authority
